

Visual Illusions and Your Brain

With Professor Steve Franconeri, Department of Psychology

You might not think about it, but there are actually many ways of interpreting the image that enters your eye.

An interpretation is usually chosen for you automatically by your visual system, guided by hidden assumptions about the way the world works. Clever illusions break these assumptions, providing a look ‘under the hood’ of your visual system. In other words, ‘what you see’ is not necessarily ‘what you get.’ Come see why your favorite optical illusions work!

JUNIOR SCIENCE CAFÉ 1
